

N1 Health: Data Challenge Results

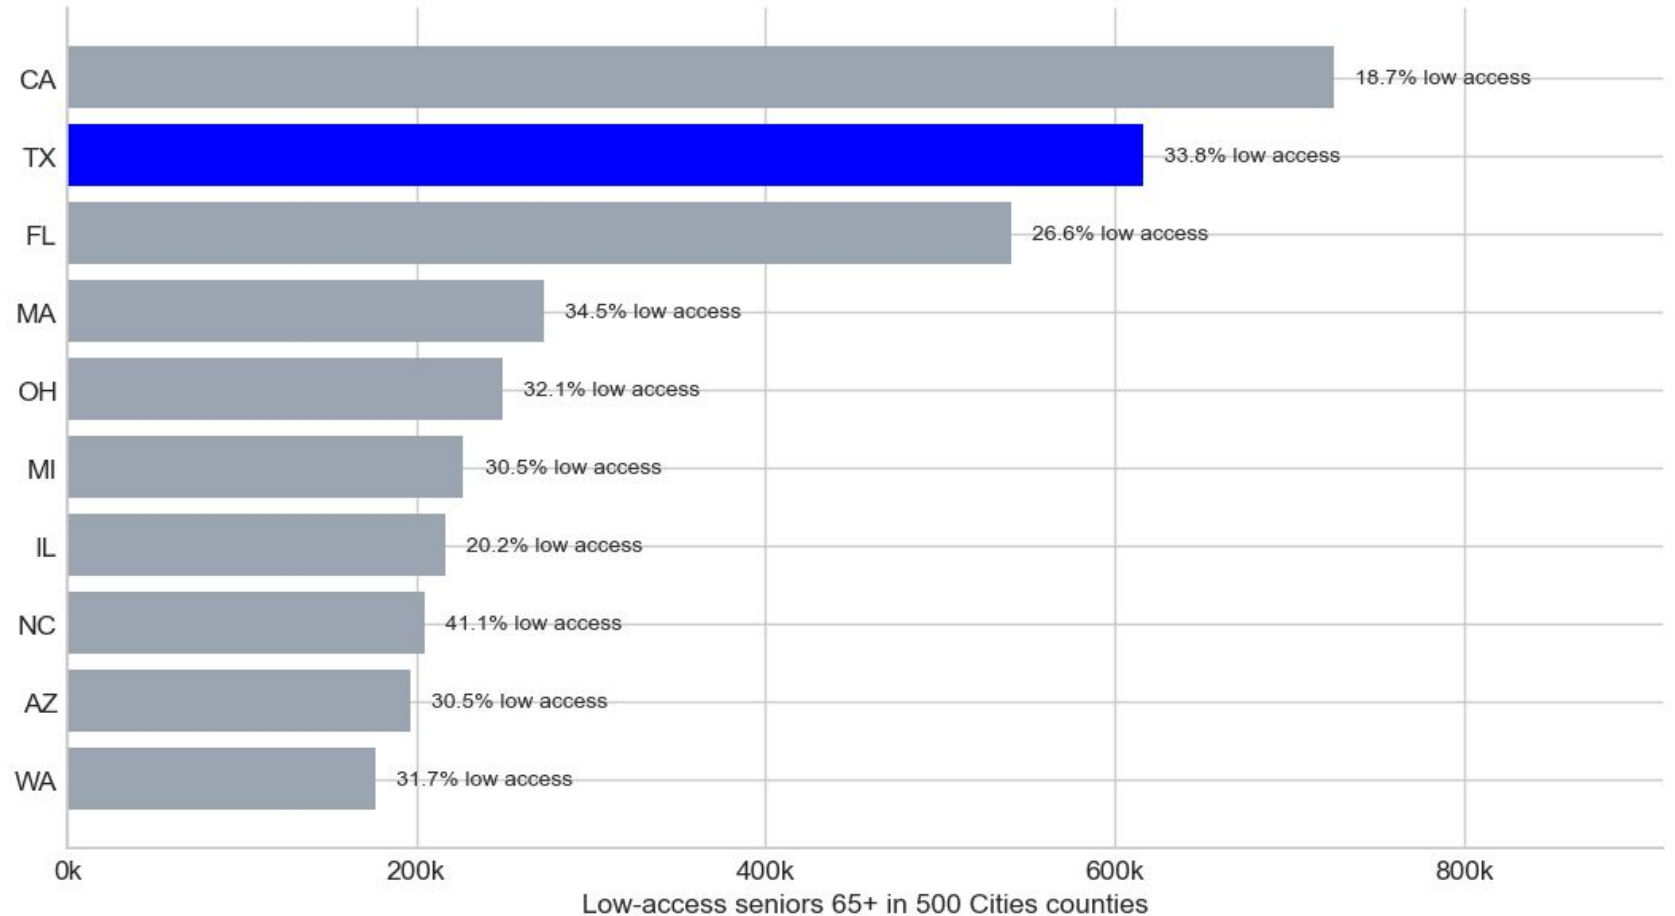

Sidney Liu

Summary

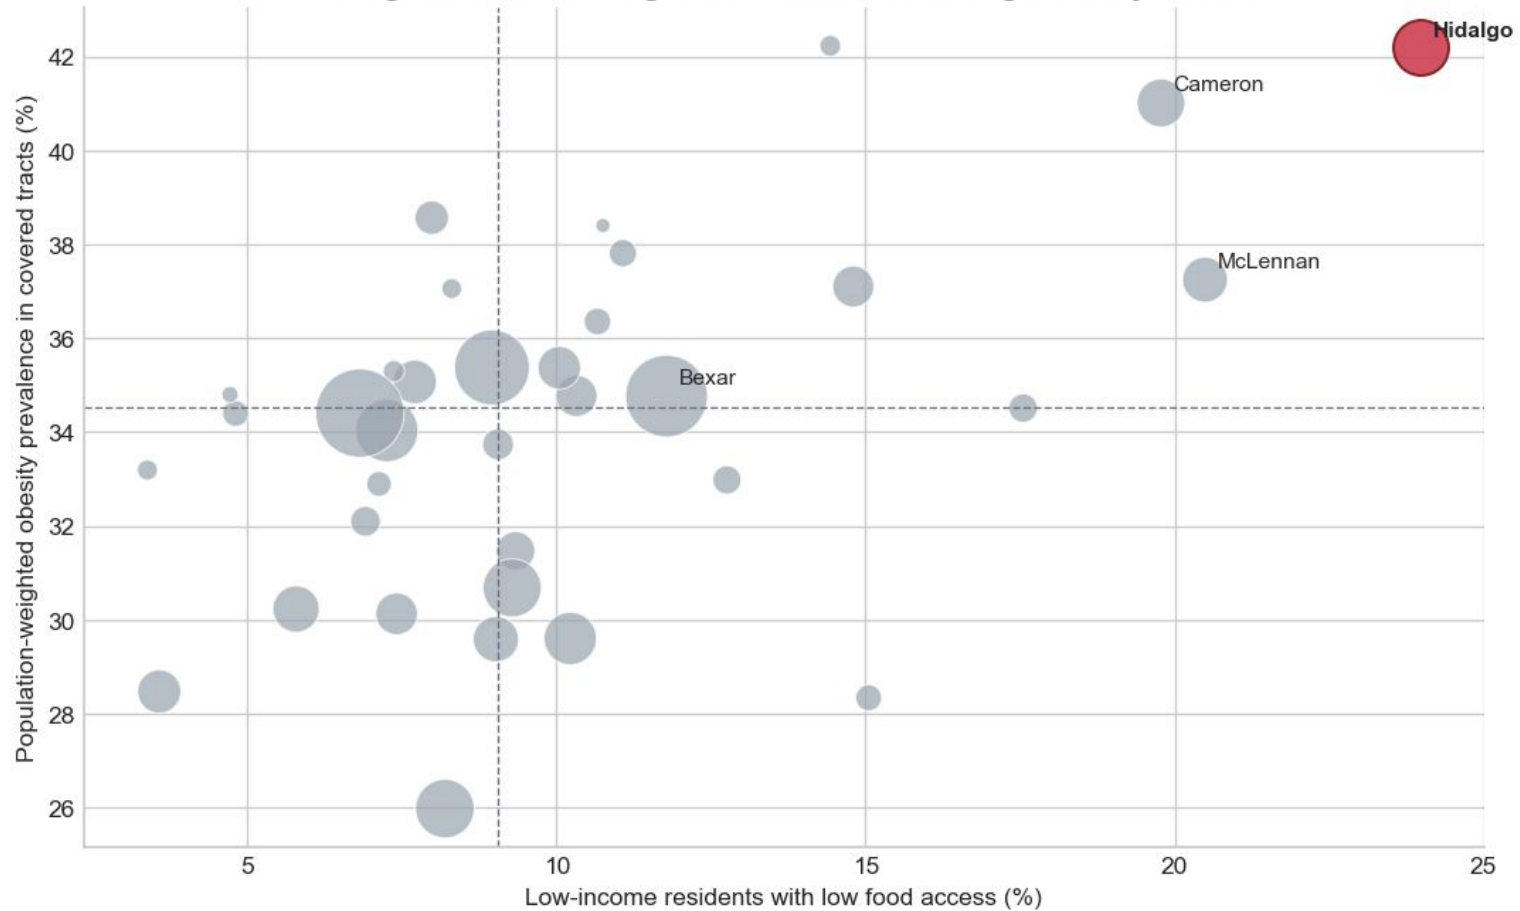

Texas, a large, high-need area

- Among Texas counties represented in the joint 500 Cities analysis, approximately **1.87 million low-income residents** had **low access to stores** in 2015.
 - These counties include an estimated **616k senior adults age 65+ with low food access**—about **33.8%** of the entire senior population.
 - Texas also has a substantial burden of chronic health conditions across its covered census tracts, including **diabetes, obesity, and high cholesterol**.
 - Counties with less favorable food-access conditions tend to have higher diabetes and obesity prevalence in this analysis. This relationship is **associational**, however, not causal.
 - These findings make Texas a strong setting to deploy a targeted program that helps senior adults access affordable, healthier foods.
- 

Texas has a substantial food-access need among the senior populace

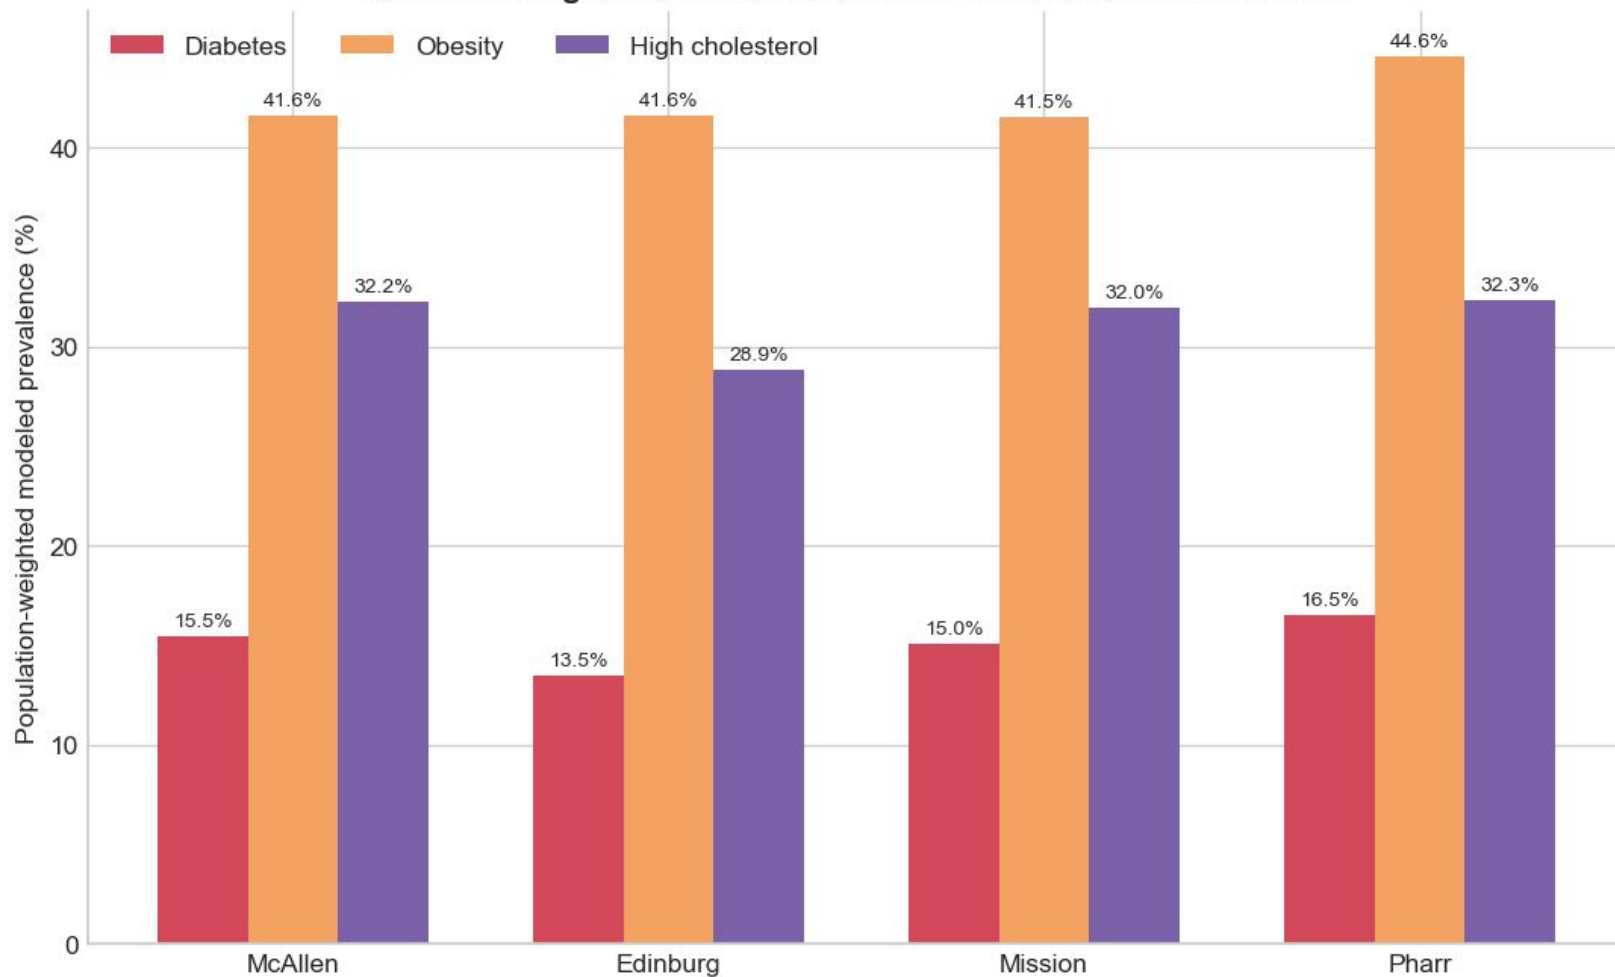

Hidalgo seniors have high food-access need & high obesity burden

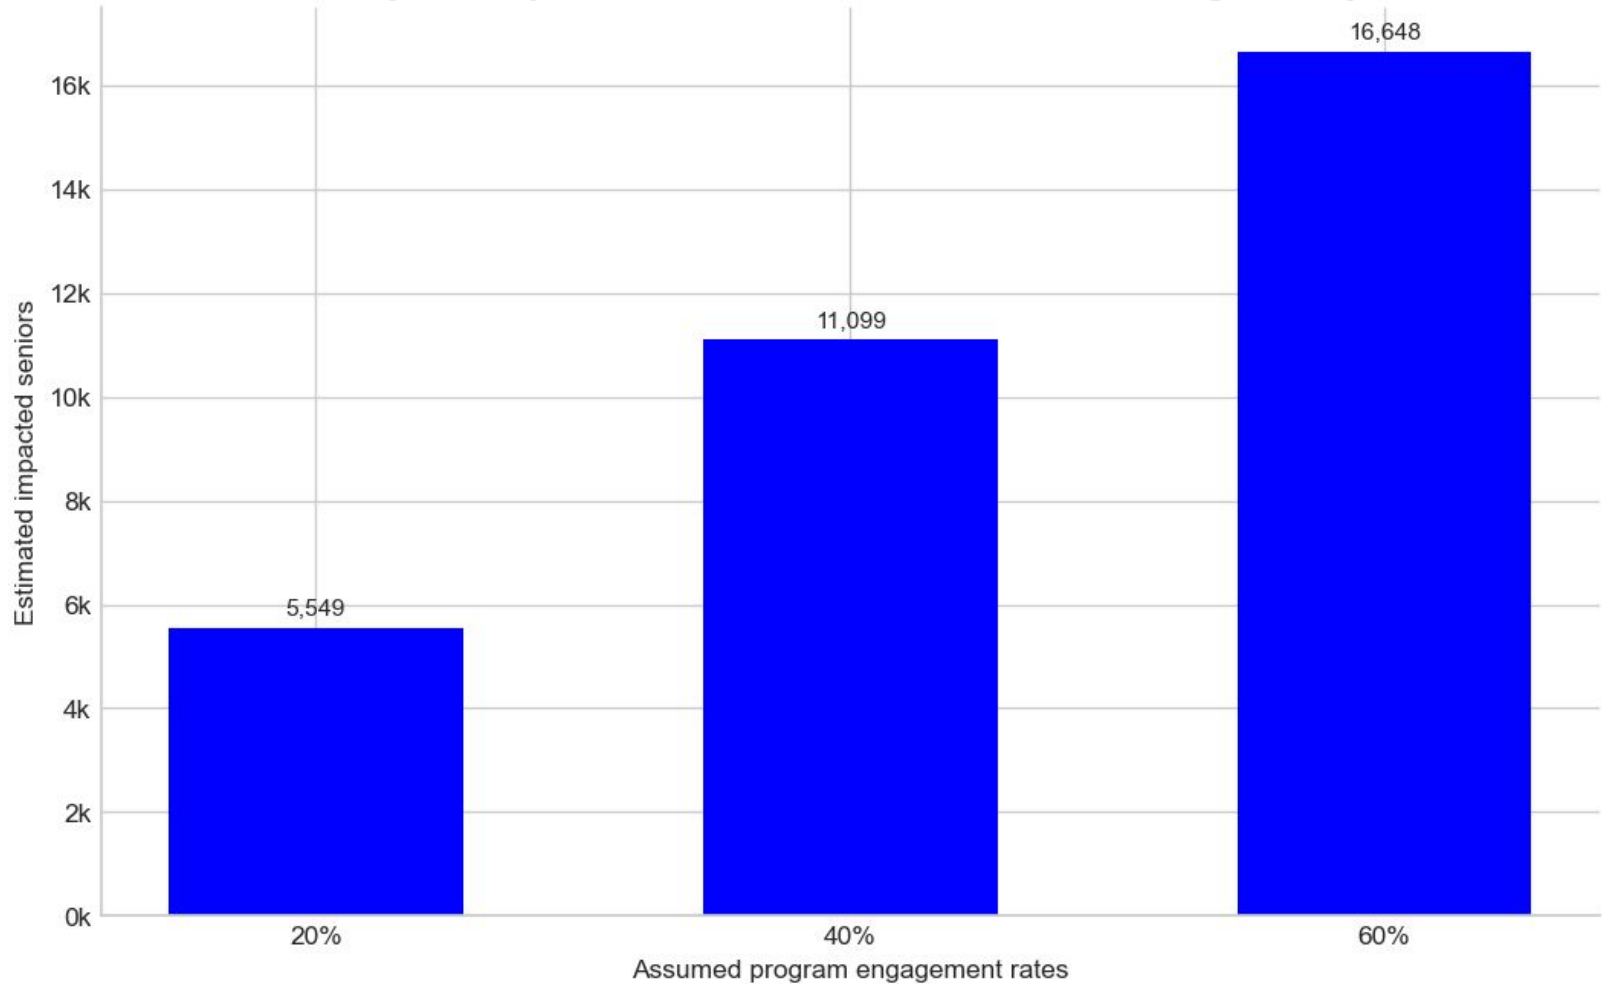

Bubble area = low-access seniors in the county
Dashed lines = Texas county median

All four Hidalgo cities show substantial chronic-condition burden

Projected impact from 27,747 low-access seniors in Hidalgo County

Conclusion

- Hidalgo County has an estimated **27k adults age 65+ with low food access**, providing meaningful scale for a targeted food-access program.
 - **24% of low-income residents have low food access**, indicating a substantial barrier to obtaining affordable, healthy food.
 - Across the **354k residents in Hidalgo tracts** covered by the 500 Cities dataset, estimated health burdens are high:
 - **15.2%** diabetes prevalence
 - **31.5%** high-cholesterol prevalence
 - **42.2%** obesity prevalence
 - In the matched Texas analysis, counties with less favorable food-access conditions tend to also have higher diabetes and obesity prevalence. Although, this is associational, not causal, we identify communities where **healthy-food access support** may be especially relevant.
 - **Hidalgo** is therefore a strong candidate for a food-access program: it combines a demonstrable **access need**, a sizable **senior** population, and elevated **chronic-disease burden** against which program outcomes can be monitored.
-
